Parity Class

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- Any counting problem in $\#\mathbf{P}$ can be solved in polynomial space
 - ❖ reusing space enumerate all solutions in lexicographic order, keeping a counter of the ones that we have seen
- Thus $\#\mathbf{P}$ like the polynomial hierarchy is no more powerful than polynomial space
- A question arises:
 - ❖ how do the polynomial hierarchy and $\#\mathbf{P}$ compare in power?
 - ❖ or, does counting takes you further than quantifiers?

Parity Class continued

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- **Definition.** A language L is in the class $\oplus\mathbf{P}$ (“odd P” or “parity P”) if there is a nondeterministic Turing machine M such that for all strings x we have $x \in L$ if and only if the number of accepting computations of M on input x is odd.
 - ❖ equivalently if there is a polynomially balanced and polynomially desirable relation R such that $x \in L$ if and only if the number of y 's such that $(x, y) \in R$ is odd
- The following problems are defined:
 - ❖ \oplus SAT: given a set of clauses, is the number of satisfying truth assignments odd?
 - ❖ \oplus HAMILTON PATH: given a graph, does it have an odd number of Hamilton Paths?

Parity Class continued

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- **Theorem:** $\oplus\text{SAT}$ and $\oplus\text{HAMILTON PATH}$ are $\oplus\mathbf{P}$ -complete.
 - ❖ **Proof:** They are in $\oplus\mathbf{P}$ based on the previous second definition of $\oplus\mathbf{P}$ and the definition of the problems. Completeness follows from the parsimonious reductions of any problem in $\#\mathbf{P}$ to $\#\text{SAT}$ and from that to $\#\text{HAMILTON PATH}$.

Parity Class continued

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- **Theorem:** $\oplus\mathbf{P}$ is closed under complement.

- ❖ **Proof:** The complement of $\oplus\text{SAT}$ (whether there is an even number of satisfying truth assignments) is obviously $\mathbf{co}\ \oplus\ \mathbf{P}$ -complete. Next we reduce this language to $\oplus\text{SAT}$. Given any set of clauses on n variables x_1, \dots, x_n we add the new variable z , we add to all clauses the literal z , and add the n clauses $(z \Rightarrow x_i)$ for $i = 1, \dots, n$. Thus any satisfying truth assignment of the old expression is still satisfying (with $z = \text{false}$), and we have the extra all-true satisfying truth assignment (the only one with $z = \text{true}$). Hence we increased the number of satisfying truth assignments by one and this is a reduction from the complement of $\oplus\text{SAT}$ to $\oplus\text{SAT}$. Since $\oplus\text{SAT}$ is both $\oplus\mathbf{P}$ -complete and $\mathbf{co}\ \oplus\ \mathbf{P}$ -complete and these classes are closed under reductions it follows that $\oplus\mathbf{P} = \mathbf{co}\ \oplus\ \mathbf{P}$.

Toda's Theorem

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- **Theorem (Toda's Theorem):** $\text{PH} \subseteq \text{P}^{\#\text{SAT}}$
 - ❖ Which means that we can solve any problem in the polynomial hierarchy given an oracle to a $\#\text{P}$ -complete problem.
- Because **PP** (more than half of the computations of a nondeterministic machine are accepting) is closely related to $\#\text{SAT}$
 - ❖ $\text{PH} \subseteq \text{P}^{\text{PP}}$

An alternative to Toda's Theorem

Outline

Parity Class & Toda's Theorem

❖ The Parity Class

❖ Toda's Theorem

❖ Weaker Oracle

Counting Classes

The End

- $\oplus P$ captures a fairly weak aspect of counting: the parity of the number of solutions.
- But it can be shown that if an **RP** machine is equipped with an $\oplus P$ oracle it can simulate all of **NP**.
- This result uses oracle machines that are more powerful and a much weaker oracle. The class captured is the lowest level of **PH**.
- **Theorem: $NP \subseteq RP^{\oplus P}$**
 - ❖ the proof uses similar arguments of the proof of Toda's theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- **Definition.** A *counting machine* (CM) is a nondeterministic Turing machine running in polynomial time with two halting states: accepting and rejecting.
 - ❖ Every computational path must end in one of these states.
- **Definition.** Let M be a CM. We define the function $\#M : \Sigma^* \rightarrow \mathbf{Z}^+$ to be such that for all $x \in \Sigma^*$, $\#M(x)$ is the number of accepting computation paths of M on input x .
 - ❖ Similarly, $\text{Total}_M : \Sigma^* \rightarrow \mathbf{Z}^+$ is the total number of computation paths of M on input x .
 - ❖ The CM \bar{M} is the machine identical to M but with the accepting and rejecting states interchanged.

The Classes

Outline

Parity Class & Toda's Theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- $\#\mathbf{P} \stackrel{\text{df}}{=} \{\#M \mid M \text{ is a CM}\}$
- \mathbf{PP} is the class of all languages L such that there exists M and \mathbf{FP} function f such that, for all x ,

$$x \in L \Leftrightarrow \#M(x) > f(x)$$

the function f is the threshold of M

- $C_{=}\mathbf{P}$ is the class of all languages L such that there exists M and an \mathbf{FP} function f such that, for all x ,

$$x \in L \Leftrightarrow \#M(x) = f(x)$$

The Classes continued

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- For $k \geq 2$, define $\text{Mod}_k \mathbf{P}$ to be the class of all languages L such that there exists M such that, for all x ,

$$x \in L \Leftrightarrow \#M(x) \not\equiv 0 \pmod{k}$$

the class $\text{Mod}_k \mathbf{P}$ is also called $\oplus \mathbf{P}$ (“Parity P”) (Papadimitriou and Zachos, Goldschlager and Parberry)

- For any language L , $L \in \mathbf{FewP}$ if and only if there exist a CM M and a polynomial p such that for all $x \in \Sigma^*$, $\#M(x) \leq p(|x|)$ and

$$x \in L \Leftrightarrow \#M(x) > 0$$

The Classes continued

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- For any language L , $L \in \mathbf{Few}$ if and only if there exist a CM M , a polynomial p , and a polynomial-time computable predicate $A(x, y)$ such that for all $x \in \Sigma^*$, $\#M(x) \leq p(|x|)$ and

$$x \in L \Leftrightarrow A(x, \#M(x))$$

we know $\mathbf{FewP} \subseteq \mathbf{NP}$ but this is not known for \mathbf{Few}

Need for Closure

Outline

Parity Class & Toda's Theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ **Need for Closure**

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- The function class $\#P$ lacks an important closure property
 - ❖ $\#P$ functions cannot take on negative values
 - ❖ it is not closed under subtraction
- Remedy: the function class $\text{Gap}P$ is a natural alternative
 - ❖ $\text{Gap}P$ is the closure of $\#P$ under subtraction
 - ❖ has all the other useful properties of $\#P$ as well
- $\text{Gap}P$ is a function class consisting of differences, or “gaps”
 - ❖ between the number of accepting and rejecting paths of **NP** Turing machines

Gaps

Outline

Parity Class & Toda's Theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

- **Definition.** If M is a CM, define the function $\text{gap}_M : \Sigma^* \rightarrow \mathbf{Z}$

$$\text{gap}_M \stackrel{\text{df}}{=} \#M - \#\bar{M}$$

- gap_M represents the gap between the number of accepting and the number of rejecting paths of M
- The natural gap analog of the function class $\#\mathbf{P}$

❖ **Definition.**

$$\text{Gap}\mathbf{P} \stackrel{\text{df}}{=} \{\text{gap}_M \mid M \text{ is a CM}\}$$

Gaps continued

Outline

Counting Classes

- ❖ Definitions
- ❖ The Classes
- ❖ Need for Closure
- ❖ Gaps
- ❖ Closure Properties
- ❖ Closure

The End

- Closure Property 1.

$$\text{GapP} \circ \text{FP} = \text{GapP} \text{ and } \text{FP} \subseteq \text{GapP}$$

- Closure Property 2.

$$\text{If } f \in \text{GapP} \text{ then } -f \in \text{GapP}$$

Closure Properties 3-4

Outline

Parity Class & Toda's Theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

● Closure Property 3.

If $f \in \text{GapP}$ and q is a polynomial, then the function

$$g(x) \stackrel{\text{df}}{=} \sum_{|y| \leq q(|x|)} f(\langle x, y \rangle)$$

is in GapP

● Closure Property 4.

If $f \in \text{GapP}$ and q is a polynomial, then the function

$$g(x) \stackrel{\text{df}}{=} \prod_{0 \leq y \leq q(|x|)} f(\langle x, y \rangle)$$

is in GapP

Closure Properties 5-6

Outline

Parity Class & Toda's Theorem

Counting Classes

❖ Definitions

❖ The Classes

❖ Need for Closure

❖ Gaps

❖ Closure Properties

❖ Closure

The End

● Closure Property 5.

If $f \in \text{GapP}$, $k \in \text{FP}$, and $k(x)$ is bounded by a polynomial in

$|x|$, then the function $g(x) \stackrel{\text{df}}{=} \binom{f(x)}{k(x)}$ is in GapP

● Closure Property 6.

If $f, g \in \text{GapP}$ and $0 \leq g(x) \leq q(|x|)$ for some polynomial q ,

then the function $h(x) \stackrel{\text{df}}{=} f(\langle x, g(x) \rangle)$ is in GapP

Corollary
